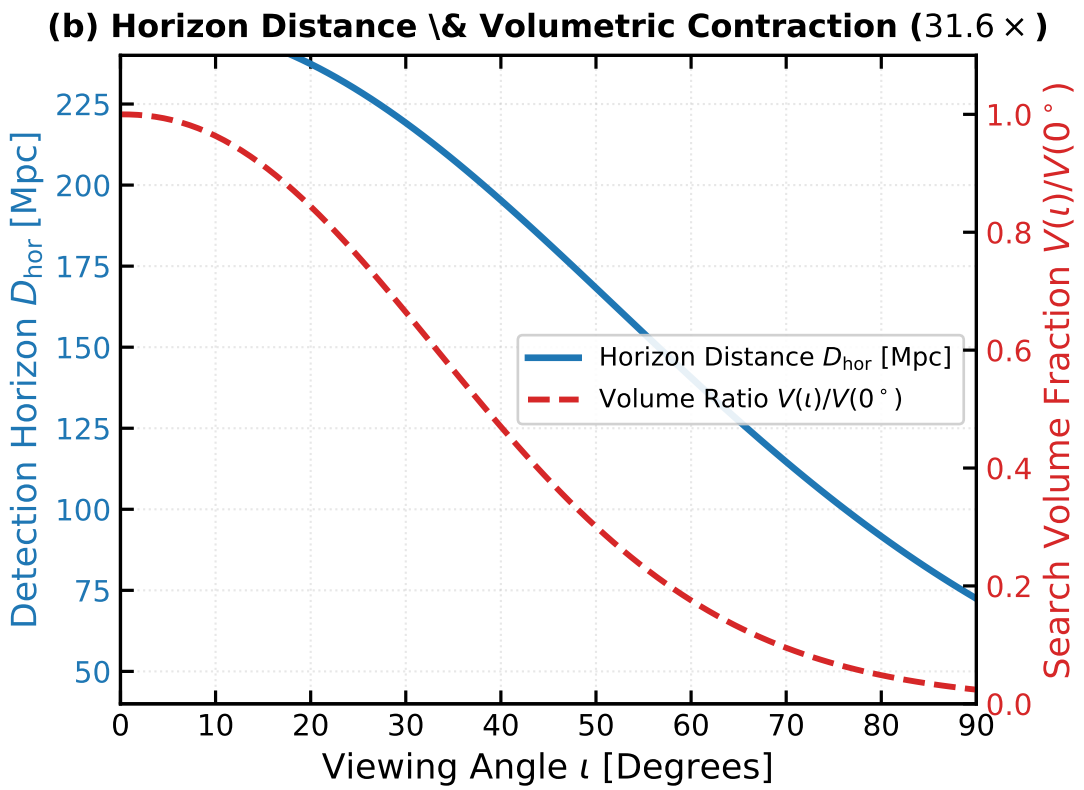
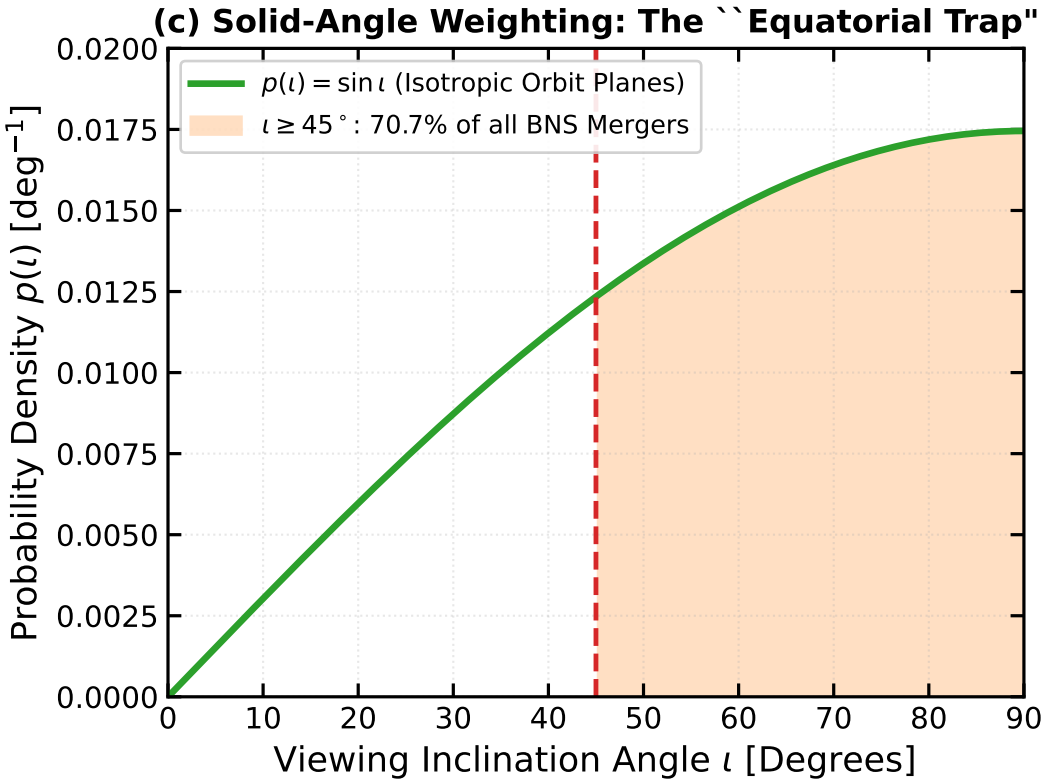
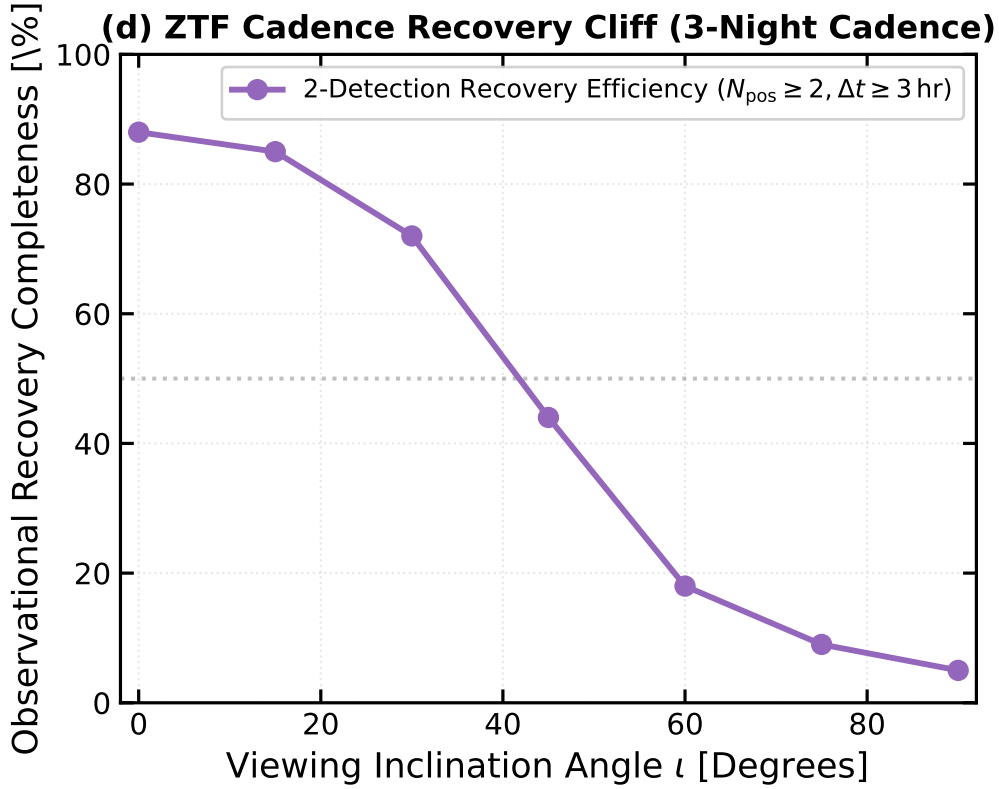
(a) Lanthanide Curtaining in r-band Lightcurves
Absolute Magnitude M_r [AB mag]
Time Since Merger $t - t_0$ [Days]
$\iota = 0^\circ$ (Polar)
$\iota = 26^\circ$ (Polar)
$\iota = 45^\circ$ (Equatorial)
$\iota = 60^\circ$ (Equatorial)
$\iota = 90^\circ$ (Equatorial)



(b) Horizon Distance \& Volumetric Contraction (31.6 ×)
Detection Horizon D_{hor} [Mpc]
Search Volume Fraction $V(\iota)/V(0^\circ)$
Viewing Angle ι [Degrees]
Horizon Distance D_{hor} [Mpc]
Volume Ratio $V(\iota)/V(0^\circ)$



(c) Solid-Angle Weighting: The ``Equatorial Trap"
Probability Density $p(\iota)$ [deg^{-1}]
Viewing Inclination Angle ι [Degrees]
$p(\iota) = \sin\iota$ (Isotropic Orbit Planes)
$\iota \geq 45^\circ$: 70.7% of all BNS Mergers



(d) ZTF Cadence Recovery Cliff (3-Night Cadence)
Observational Recovery Completeness [\%]
Viewing Inclination Angle ι [Degrees]
2-Detection Recovery Efficiency ($N_{pos} \geq 2, \Delta t \geq 3$ hr)
