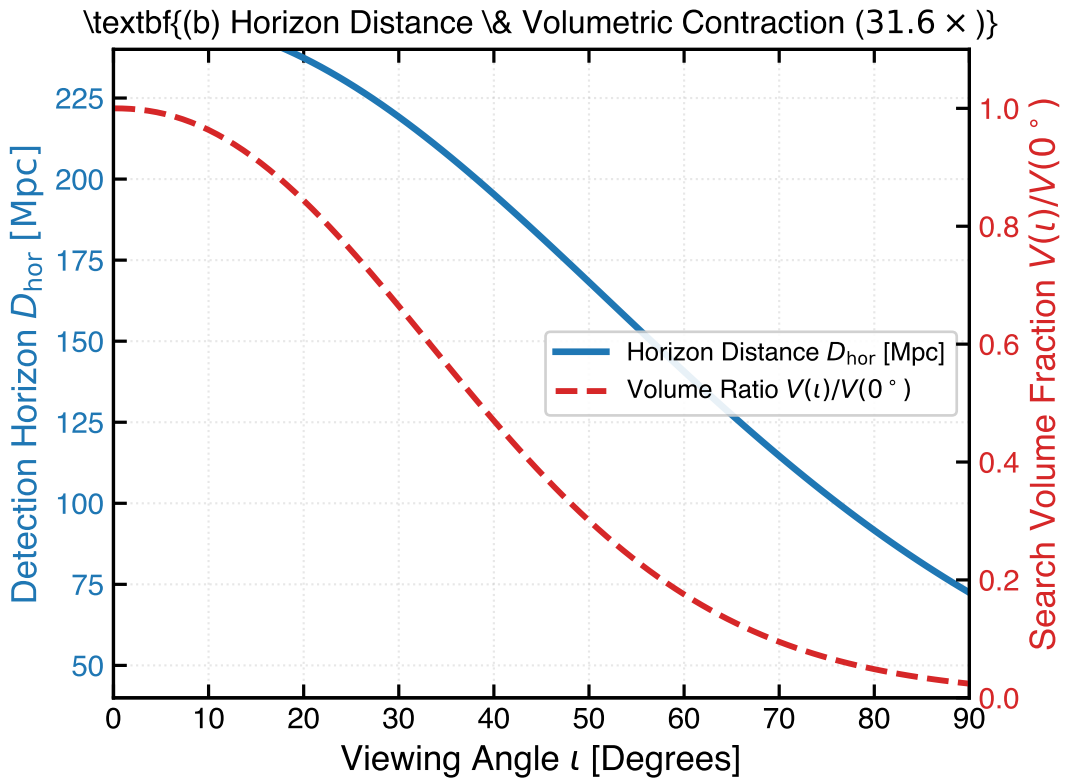
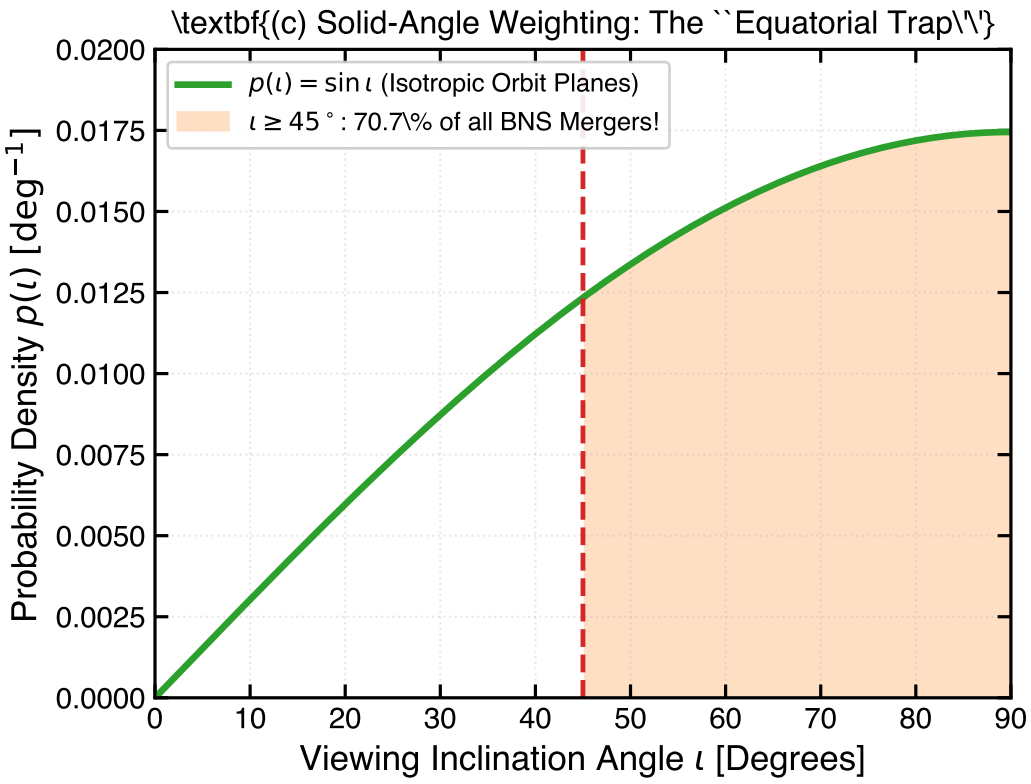
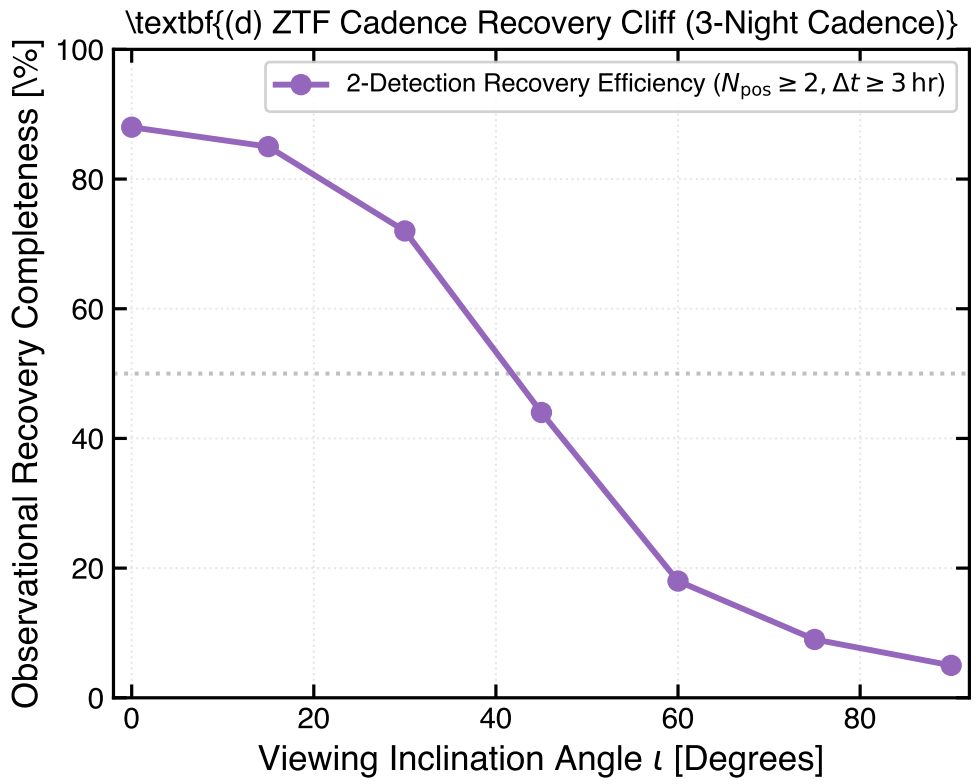
\textbf{(a) Lanthanide Curtaining in r-band Lightcurves}
Absolute Magnitude M_r [AB mag]
Time Since Merger $t - t_0$ [Days]
$\iota = 0^\circ$ (Polar)
$\iota = 26^\circ$ (Polar)
$\iota = 45^\circ$ (Equatorial)
$\iota = 60^\circ$ (Equatorial)
$\iota = 90^\circ$ (Equatorial)



\textbf{(b) Horizon Distance \& Volumetric Contraction (31.6 ×)}
Detection Horizon $D_{\rm hor}$ [Mpc]
Search Volume Fraction $V(\iota)/V(0^\circ)$
Viewing Angle ι [Degrees]
Horizon Distance $D_{\rm hor}$ [Mpc]
Volume Ratio $V(\iota)/V(0^\circ)$



\textbf{(c) Solid-Angle Weighting: The ``Equatorial Trap\'\'}
Probability Density $p(\iota)$ [deg^{-1}]
Viewing Inclination Angle ι [Degrees]
$p(\iota) = \sin\iota$ (Isotropic Orbit Planes)
$\iota \geq 45^\circ$: 70.7\% of all BNS Mergers!



\textbf{(d) ZTF Cadence Recovery Cliff (3-Night Cadence)}
Observational Recovery Completeness [\%]
Viewing Inclination Angle ι [Degrees]
2-Detection Recovery Efficiency ($N_{\rm pos} \geq 2$, $\Delta t \geq 3$ hr)
